

A. Miseryfjell and Oswaldfjellet.

Looking southeast. In the background to the right are seen the plateaux of Alfred- and Hambergfjellet.

A. Koller phot. 8/s 1923.

B. Miseryfjell from the northwest.

The plateau of the mountain is made up of Spirifer Limestone sloping northwards, and resting unconformably on Devonian sandstones and shales. The peaks are, from the left: Skuld, Verdande, and Urd, consisting of Triassic beds. The surface in the foreground is covered by angular fragments of the bedrock below, namely Culm sandstone.
