

Kongsfjorden (MOSJ) cruise

14-17 July 2015

Cruise report

[Pick the date]

MOSJ survey - Kongsfjorden

MOSJ (Environmental monitoring – Svalbard and Jan Mayen, www.mosj.npolar.no/) is a program to monitor changes in the Arctic Ecosystem at Svalbard and Jan Mayen. As a part of MOSJ, the survey in Kongsfjorden - Fram Strait (KongHau) is used by NPI to monitor long term changes in phytoplankton and zooplankton as well as trophic structure of this ecosystem. The survey consists of pelagic sampling (hydrographic, biogeochemical, phytoplankton and zooplankton) and marine geological sampling.

The transect consists of 7 stations inside the fjord (Kb7, Kb6, Kb5, Kb3, Kb2, Kb2, Kb1, Kb0), 3 stations on the shelf (V12, V10, V6) and 3 stations off the shelf (KH, HG-I, HG-IV), but this year we were not able to sample the stations in the FramStrait due to short cruise time, delayed start and too much wind. Since the CTD broke down at station V6 no water was sampled at this station. Detailed information regarding the procedures of sampling and processing of the different parameters are found in the document “Kongsfjorden MOSJ Cruise 2015 Cruise and sampling plan”. Below is a short description and preliminary results of the different projects as well as an overview of the samples. Detailed information regarding the sampling can be found in the sample log and protocol for the treatment of the different parameters can be found in the cruise plan.

Participants

#	Name	Institute	Field/Function	e-mail
1	Katrine Husum	NPI	Marinegeology/Cruise leader	katrine.husum@npolar.no

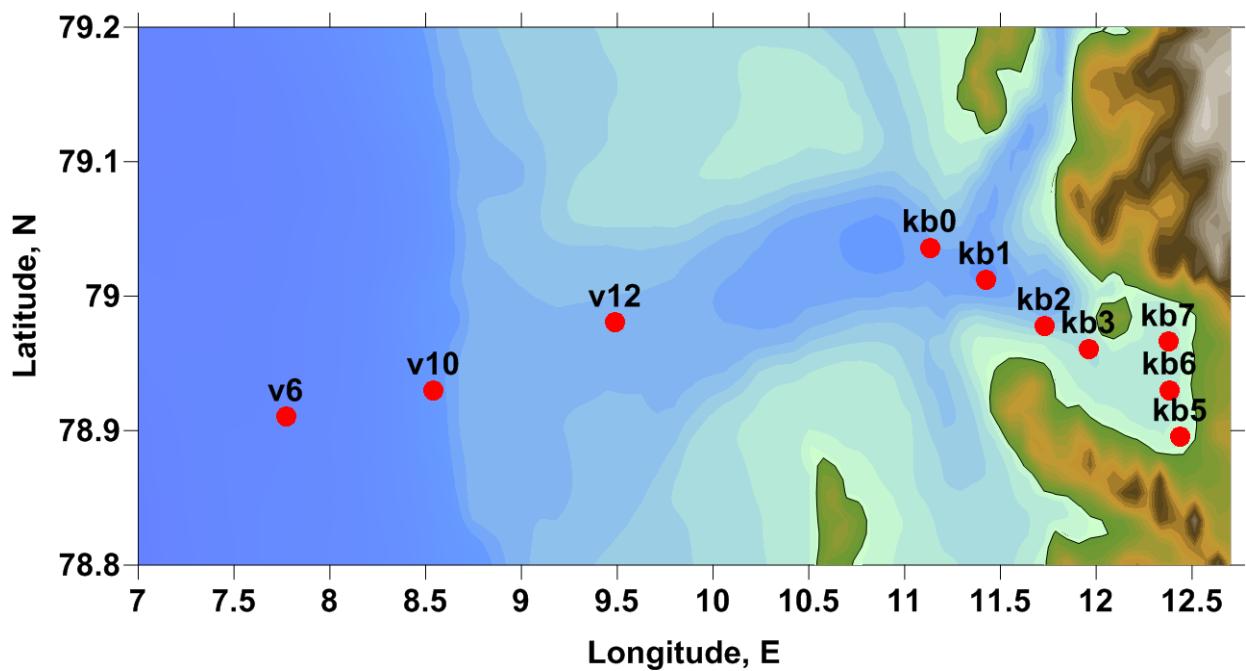

Figure 1 CTD station positions

Pelagic survey

Hydrographic survey

Responsible: *Olga Pavlova (NPI) & Jakob Grahn (UiT)*

Instruments

CTD (Seabird SBE 911) was used for collection of vertical profiles of conductivity (salinity), temperature, chlorophyll & radiance. The CTD rosette is also equipped with water sampling bottles.

ADCP (acoustic Doppler current profiler) was used for measuring water currents throughout the water column, by ship-mounted ADCP 150 kHz (upper ~200 m)

Hydrographic structure & Vertical sections

Positions of the CTD stations are presented in Figure 1 and Table1. The most distinct physical features were the area of high temperature in the surface layer over the slope (V6, V10 and V12) and in the central part of the Kongsfjorden (Kb1, Kb2). Such high temperature in the surface layer can be related with summer heating (Fig. 2). Salinity in the upper layer (0-50 m) is relatively low (Fig. 3). It decreases from 35.1 psu at the western station V6 to 30.3 psu at the eastern stations Kb5-Kb7. Low salinities here can be associated with melting sea ice and glaciers. Below 800 m, in the western part of the transect, the temperatures are negative and hydrography has the typical Arctic Water characteristics. Vertical distribution of fluorescence (Fig. 4) shows that maximum values ($3.5\text{-}4 \text{ mg m}^{-3}$) of this characteristic, associated with chlorophyll maximum concentration, are in the layer of 25-30 m (V12, Kb0, Kb1, Kb5). In the other parts of this transect the fluorescence is much lower.

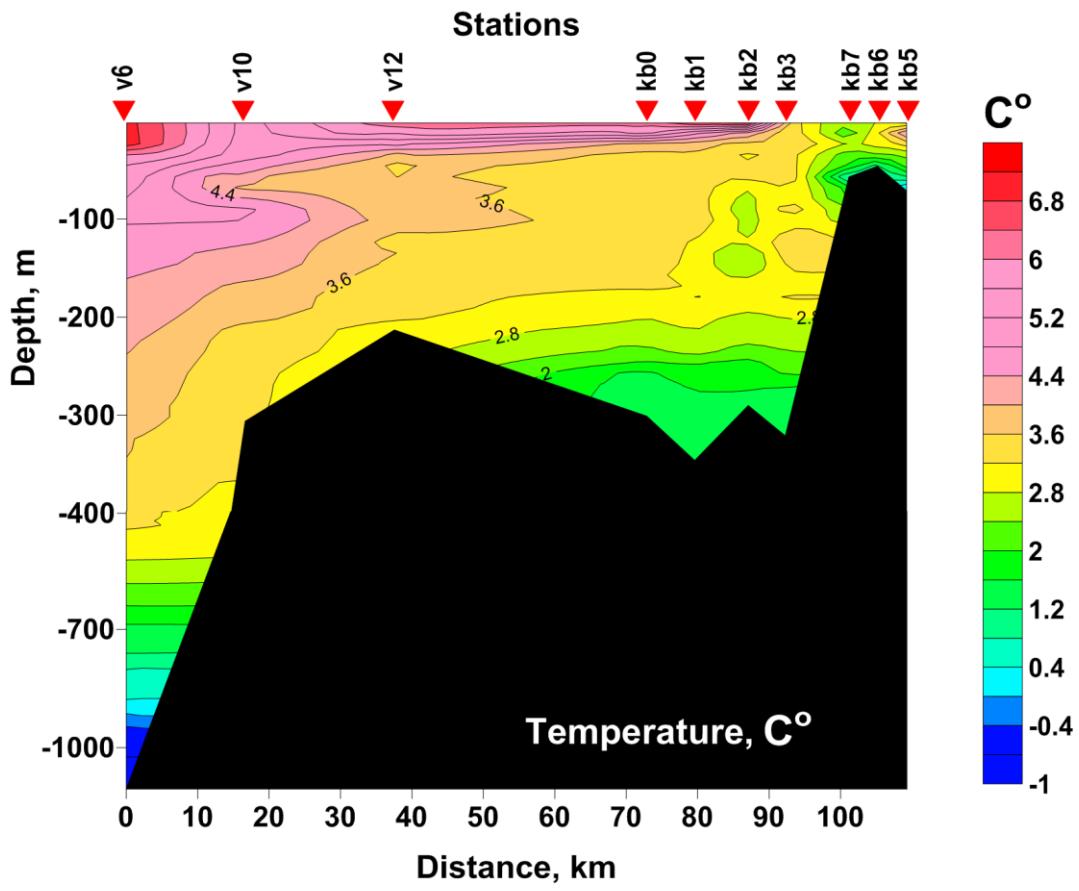

Figure 2 Vertical temperature distribution at the transect in the Kongsfjorden

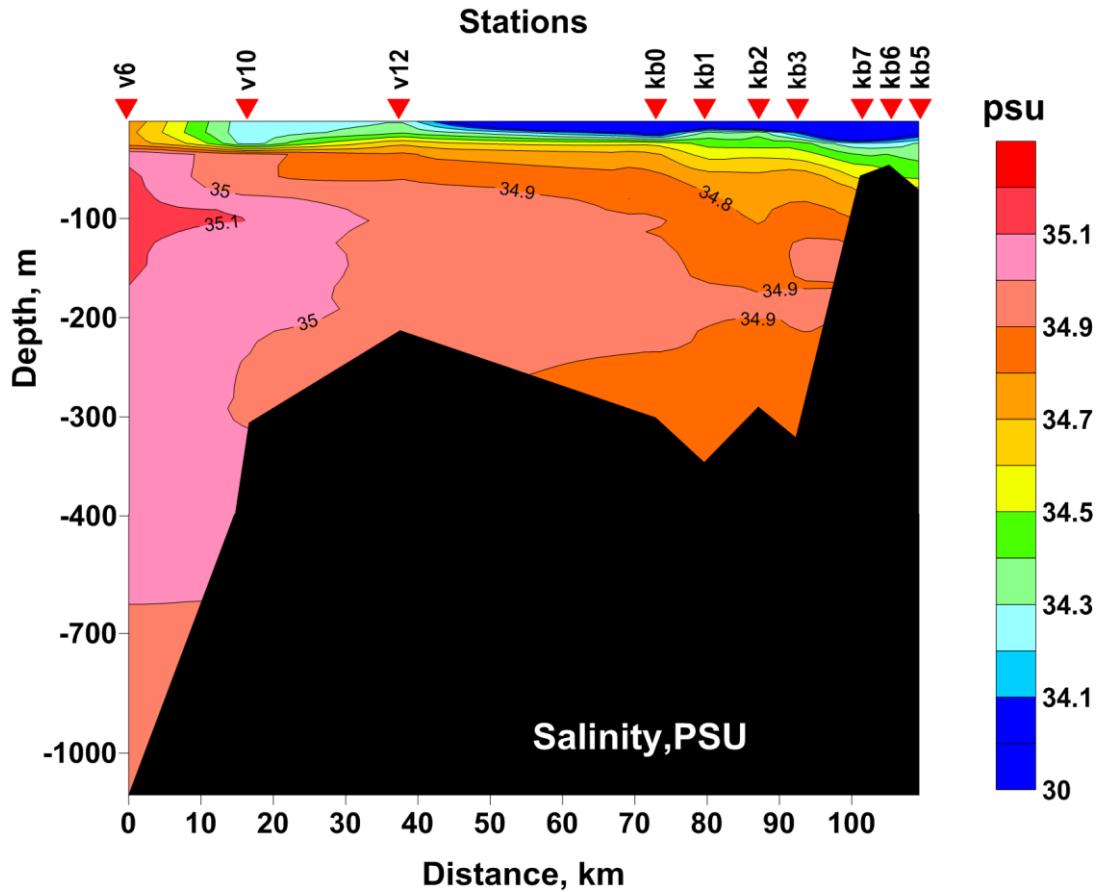

Figure 3 Vertical salinity distribution at the transect in the Kongsfjorden

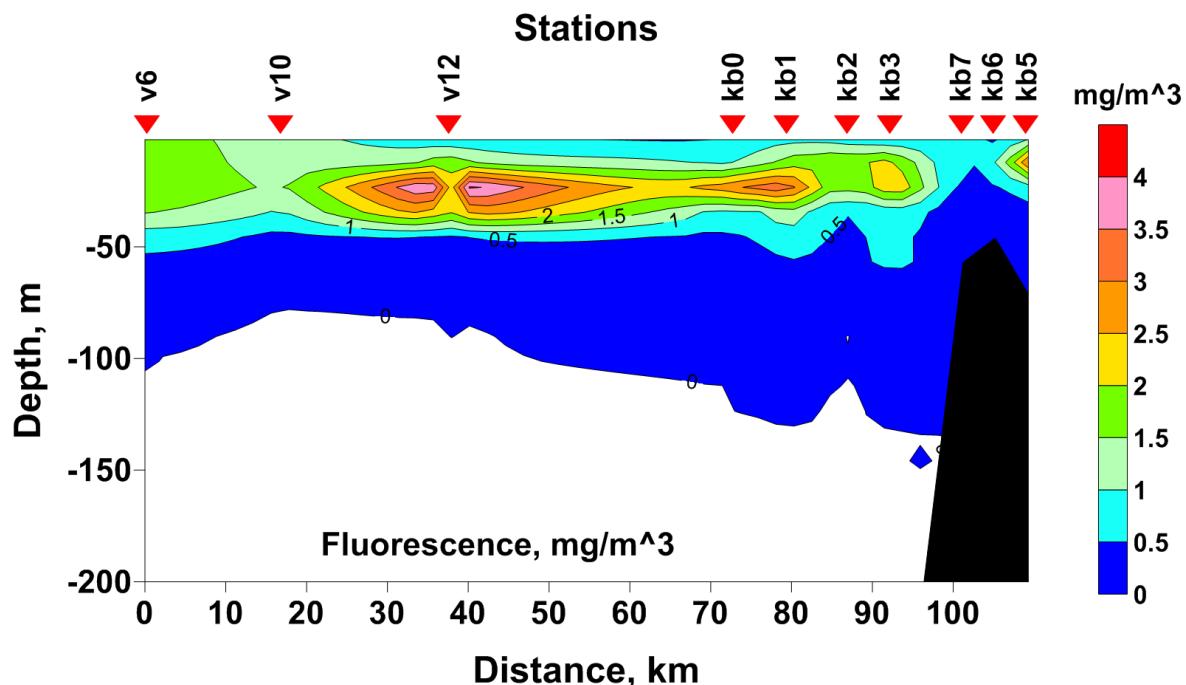

Figure 4 Fluorescence distribution at the transect in the Kongsfjorden

Biogeochemical variables and phytoplankton

Responsible: Jozeph Wictor (IOPAS), Agnieszka Tatarek (IOPAS), Svein Kristiansen (UiT) & Anette Wold (NPI)

Water samples were collected from Niskin bottles from the CTD rosette. Chlorophyll and ammonium samples were analyzed directly on board. Samples for phyto- and microplankton taxonomy will be sent with RV *Oceania* and will be analyzed at IOPAS in Poland. Particulate organic carbon and nitrogen (POC/PTDN) will be analysed at SYKE in Helsinki by Hermanni Kartokallio. Nutrient samples will be analyzed at IMR by Kjell Gundersen.

The chlorophyll concentrations were relative low and ranged from 1 to 5 mg m⁻³ in the upper 40 m (Fig. 5). The highest concentrations were at the shelf outside the fjord at between 20-40m depth. The niskin bottles of the CTD rosette did not work at station V6 so there is no record from this station.

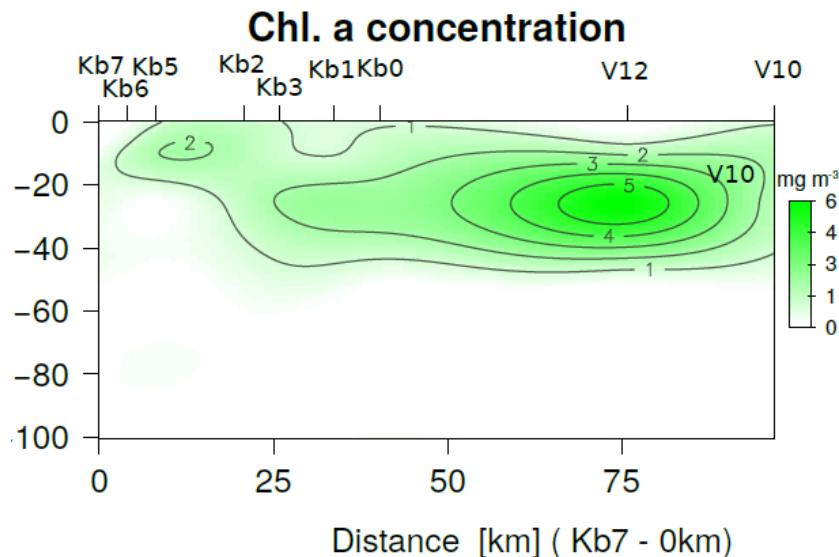

Figure 5 Chlorophyll *a* concentration (mg m^{-3}) in Kongsfjorden from Kb7 to V6 (Note different direction than the other figures)

Ammonium concentrations were high at inner stations and decreased outwards. Preliminary concentrations at stations Kb7, Kb6, Kb5, Kb3 and Kb2 were in the range 2-3 mmol m⁻³. The concentrations decreased at station Kb1 and at the subsequent stations (Kb0, V12 and V10). V10 was the last and outermost station sampled and the preliminary concentrations were <0.5 mmol m⁻¹ in the upper 25 m of the water column.

Zooplankton

Responsible: Anette Wold (NPI)

Mesozooplankton was sampled with multiple plankton sampler (MPS, Hydro-Bios Kiel), consisting of five closing nets with 0.25 m² opening and 200 µm mesh size. Macrozooplankton was sampled with a Midwater Isaak Kit Trawls (MIK) with 3.14 m² opening and 1500 µm mesh from the total water column. The standard depths for MPS samples was as follows:

Bottom depth <600m; bottom-200m, 200-100m, 100-50m, 50-20m, 20-0m

Bottom depth >600m; bottom-600m, 600-200m, 200-50m, 50-20m, 20-0m

All MPS samples were preserved immediately after sampling and stored on 4% formaldehyde solution buffered with hexamintetrahydrat. The MIK samples were splitted in two, half of the samples were frozen and half were stored on 4% formaldehyde solution. The frozen samples will be sent to Padmini Dalpadado, IMR for examination of gonad status of krill while the taxonomical sampled will be analysed either at NP or at IMR.

The zooplankton community in the inner part of Kongsfjorden was dominated by krill while the *Calanus* was dominating from Kb3 and further out.

Marine geological survey (recent and past ecosystem effects)

The overall aim is to monitor and quantify past and recent ecosystem effects of environment and climate changes. Such information is vital in order to evaluate the full range of the eco- and ocean-climate systems.

Modern monitoring: recent ecosystem effects

Responsible: *Katrine Husum (NPI) & Arto Miettinen (NPI)*

Benthic foraminifera are good monitors of environmental changes because they are very abundant in the surface sediments and very diverse even in Arctic coastal and fjord settings. Furthermore, they have a short life cycle enabling a quick response to changes. After death, the shells of the benthic foraminifera are preserved in the sediment enabling baseline studies of pre-impacted conditions back in time. Annual sampling of benthic foraminifera from 2005 – 2008 show changes in species composition, changes of production and yearly deposited foraminifera reflecting changing water masses (Jernas, 2013). During the cruise the annual monitoring of living benthic foraminifera in Kongsfjorden was continued. However, due to the delayed start of the cruise only four stations were sampled in Kongsfjorden: Kb3, Kb2, Kb1, and Kb0.

Paleoclimate - paleoceanography sampling

Responsible: *Arto Miettinen (NPI) & Katrine Husum (NPI)*

In order to obtain data on temperature, salinity etc. in the water masses from the past when it was not possible to get instrumental measurements of these factors; we study fossil micro-fauna (foraminifera) and micro-flora (diatoms) in the sediments. We also study the chemical composition of the micro-fauna/flora in addition the chemical composition of the sediments (sea ice biomarker IP25 and other structurally similar compounds, collectively called Highly Branched Isoprenoids/HBIs). Their composition and abundance depend on many environmental factors like temperature and salinity of the sea water, thus showing how the marine environment and water masses were back in time (paleo-oceanographic proxy data). This year, station Kb0 was sampled down core for analysis of paleoclimate proxies (benthic foraminifera, diatoms and HBIs).

Additional projects

Ocean Acidification

Responsible: *Agneta Fransson (NPI) & Melissa Chierichi (IMR)*

Investigate the natural calcium carbonate saturation state (Ω) in the area around Svalbard. Influence of water mass composition (Atlantic, polar, fjordwater) and freshwater (glacier, sea-ice and river) on Ω . Distribution of *Calanus*, *Limacina helicina* will be related to Ω state. Pteropods should be collected from Multinet and MIK when present and stored On 95% alcohol

CDOM

Responsible: *Mats Granskog (NPI) & Alexey Pavlov (NPI)*

The main objective is to collect CDOM samples for absorbance and fluorescence characterization of marine dissolved organic matter. This can be used as a proxy for dissolved organic carbon (DOC), and

combined with the other tracers (like ^{18}O and TA) it can also indicate optical properties of water masses. Samples will be collected at all stations along the Kongsfjorden transect, at the same depths as oxygen isotopes, DIC/AT and methane.

***Calanus glacialis* phenology**

Responsible: Kaja Ostaszewska (IOPAS)

The collection of *Calanus glacialis* will be part of the PhD thesis “Zooplankton as the basic food source for bi-environmental birds in the warming Arctic”. Samples will be collected from the feeding grounds of little auk at three times during the season, in two different in climate and oceanographic conditions areas (Kongsfjord, Hornsund). The aim is to reveal whether periods of high food requirements for little auk will match the peak of *C. glacialis* development. Samples were collected with a WP2 net at all stations except from Kb6. Samples were fixed with formaldehyde 4%.

Clione limacine

Responsible: Laurisse Boissonnot (UNIS)

The aim was to collect live animals for a subsequent feeding experiment at UNIS. The samples will be taken from 300m to surface with WP3 and MIK net. Animals were sorted out from the MIK net taken for abundance. Additional samples were collected at several stations but few animals were collected and additional sampling will be conducted in Isfjorden and Kongsfjorden later in the summer.

Ocean mooring rig: retrieval and deployment

Responsible: Kesavakumar Balakrishnan (NCAOR)

The Indian mooring team from NCAOR successfully retrieved their ocean mooring rig, which was deployed in 2014 near station Kb3 in Kongsfjorden. It was not possible to deploy it again with new instruments because the necessary wire was missing. This wire had been ordered too late (arrived in Longyearbyen two days after scheduled departure). The new mooring has successfully deployed after this cruise during the NPI Svalbard logistic cruise (Sunday July 19).

Table2 Overview of the pelagic sampling

Parameter	Kb7	Kb6	Kb5	Kb3	Kb2	Kb1	V12	V10	V6	Analyses	Project
CTD											MOSJ
